

Logic Road Map

The logic service and corresponding core module are designed to provide the a simple system-wide service for evaluating tokens, where the results for any given token may come from any source and may or may not involve calculations. In essence, the goal is to simplify data retrieval by providing a single mechanism for fetching anything from a patient's gender to their ten-year cardiac risk.

This page describes the near- and long-term vision of growth for the logic service within OpenMRS.

?

We are actively defining the road map, so this page is still in draft form.
