

App Framework Module

Overview

This module allows developers to display a homepage of *apps* and lets apps publish *extension points* that modules can connect to via *extensions*.

The App Framework module is the basis of OpenMRS 2.x (formerly, "the reference application").

We're currently on versions 2.x of this module. (Versions 1.0-1.5 are unsupported, and not compatible with the 2.x line.)

Documentation / How To

As a developer, see [App Framework Developer Documentation](#)

As an implementer or system administrator, this module provides no functionality that you can configure. You should install it if (and only if) a functional module that you want to install (e.g. one of the reference application modules) requires it.
