MDR-TB Module

The MDR-TB module is a module developed to assist in the care of patients with multi-drug resistant tuberculosis.

The current versions of the MDR-TB module are version 2.0 (for use with OpenMRS 1.6.x) and version 3.0 (for use with OpenMRS 1.9.x). Currently the 3.0 version does not provide much additional functionality, but simply provides support for running MDR-TB on OpenMRS 1.9.x. The MDR-TB module does not support OpenMRS 1.7.x or 1.8.x.

There is also an older 1.0 version available, but please note that this version is no longer supported, and there is no straightforward upgrade path from 1.0 to a higher version, so we recommend careful consideration when deciding what version of the module to deploy. Additionally, version 1.0 is only available as a "stand-alone" OpenMRS implementation, while version 2.0 can be installed on an existing OpenMRS instance, as long as the appropriate set of metadata is installed with it.

More details about each of the versions:

- MDR-TB Module Versions 2.0 & 3.0
- MDR-TB Module Version 1.0
